A partial differential equation (PDE) is a differential equation that contains unknown multivariable functions and their partial derivatives. (This is in contrast to ordinary differential equations, which deal with functions of a single variable and their derivatives.) PDEs are used to formulate problems involving functions of several variables, and are either solved in closed form, or used to ...

Equations often contain terms other than the unknowns. These other terms, which are assumed to be known, are usually called constants, coefficients or parameters.. An example of an equation involving x and y as unknowns and the parameter R is $+ =$. When R is chosen to have the value of 2 ($R = 2$), this equation would be recognized, when sketched in Cartesian coordinates, as the equation for a ...
