The concept of normal matrices can be extended to normal operators on infinite dimensional normed spaces and to normal elements in C^* -algebras. As in the matrix case, normality means commutativity is preserved, to the extent possible, in the noncommutative setting.

In linear algebra, an idempotent matrix is a matrix which, when multiplied by itself, yields itself. That is, the matrix is idempotent if and only if $E^2 = E$. For this product to be defined, E must necessarily be a square matrix. Viewed this way, idempotent matrices are idempotent elements of matrix rings

Eine Matrixnorm ist in der Mathematik eine Norm auf dem Vektorraum der reellen oder komplexen Matrizen. Neben den drei Normaxiomen Definitheit, absolute Homogenität und Subadditivität wird bei Matrixnormen teilweise die Submultiplikativität als vierte definierende Eigenschaft gefordert. Submultiplikative Matrixnormen besitzen einige nützliche Eigenschaften, so ist beispielsweise der ...

Die inverse Matrix, Kehrmatrix oder kurz Inverse einer quadratischen Matrix ist in der Mathematik eine ebenfalls quadratische Matrix, die mit der Ausgangsmatrix multipliziert die Einheitsmatrix ergibt. Nicht jede quadratische Matrix besitzt eine Inverse; die invertierbaren Matrizen werden reguläre Matrizen genannt. Eine reguläre Matrix ist die Darstellungsmatrix einer bijektiven linearen ...
