Image I 1 is the image created by mirror M 1 and image I 2 is the image created by mirror M 2. When viewing these images, light from the object will reflect off the respective mirror and travel towards the viewer's eye. I 3 is the image of an image - the image of I 2 as reflected across mirror M 1.

Reflection and Mirrors Review - Answers

Optical Mirrors are designed to reflect light for a variety of applications, including beam steering, interferometry, imaging, or illumination. Optical Mirrors are used in a wide range of industries, such as life sciences, astronomy, metrology, semiconductor, or solar.

Answer: C. Look at yourself in a plane mirror and you see your image - it is upright. The image is located on the other side of the mirror since reflected rays diverge upon reflection; when mirrors produce images on the the opposite side of the mirror, the images are said to be virtual.

The reflection and refraction we've dealt with so far have focused only on light interacting with flat surfaces. Lenses and curved mirrors are optical instruments designed to focus light in predictable ways. While light striking a curved surface is more complicated than the flat surfaces we've looked at already, the principle is the same.
