Mechanical Vibrations. Vibration is the motion of a particle or a body or system of connected bodies displaced from a position of equilibrium. Most vibrations are undesirable in machines and structures because they produce increased stresses, energy losses, because added wear, increase bearing loads, induce fatigue, create passenger discomfort in vehicles, and absorb energy from the system.

Integrate the wikipedia equation with the conditions $x(0)=0$, $v(0)=15.24$ (cauchy problem); the system is underdamped, you will find a solution like $\text{exponential} \cdot \sin$, for the maximum displacement set the condition $v(t)=0$, i found it at $t=0.01572s$, if you want further help i can give you the analytic solution but i'm not good at Latex, it's more like a math exercise than a physicist's one

In this section we will examine mechanical vibrations. In particular we will model an object connected to a spring and moving up and down. We also allow for the introduction of a damper to the system and for general external forces to act on the object. Note as well that while we example mechanical vibrations in this section a simple change of notation (and corresponding change in what the ...
