Multivariate analysis can reduce the likelihood of Type I errors. Sometimes, univariate analysis is preferred as multivariate techniques can result in difficulty interpreting the results of the test. For example, group differences on a linear combination of dependent variables in MANOVA can be unclear. In addition, multivariate analysis is ...

We will say A is $W_p(n, \sigma)$. Remarks: •The Wishart distribution is the multivariate generalization of the chi-squared distribution. • $A \sim W_p(n, \sigma)$ is positive definite with probability one if and only if $n \geq p$. •The sample covariance matrix, $S = \frac{1}{n-1} A$ is $W_p(n-1, \frac{1}{n-1} \sigma)$.
