In this section we extend the concepts from Linear Regression to models which use more than one independent variable. We explore how to find the coefficients for these multiple linear regression models using the method of least square, how to determine whether independent variables are making a significant contribution to the model and the impact of interactions between variables on the model.

R-squared tends to reward you for including too many independent variables in a regression model, and it doesn't provide any incentive to stop adding more. Adjusted R-squared and predicted R-squared use different approaches to help you fight that impulse to add too many. The protection that adjusted R-squared and predicted R-squared provide is critical because too many terms in a model can ...
