The difficulty of obtaining a converged solution for explicit schemes is well known, and results from good damping of high frequency errors, but poor damping of low frequency errors. The initial residual can be reduced quite efficiently up to a certain point, beyond which more and more iterations are required to reduce the residual by a certain amount until a converged solution is obtained.

e) Try constraining different nodes to remove rigid body motion as both the nodes and constraints can have a large influence in obtaining a converged solution. As long as the constraint is properly applied to eliminate all rigid body rotation and translation modes, the final results will be very similar.
