Modern Compiler Implementation In Java

A Java virtual machine (JVM) is a virtual machine that enables a computer to run Java programs as well as programs written in other languages that are also compiled to Java bytecode. The JVM is detailed by a specification that formally describes what is required of a JVM implementation. Having a specification ensures interoperability of Java programs across different implementations so that ...

In computing, an optimizing compiler is a compiler that tries to minimize or maximize some attributes of an executable computer program. The most common requirement is to minimize the time taken to execute a program; a less common one is to minimize the amount of memory occupied. The growth of portable computers has created a market for minimizing the power consumed by a program.

The article illustrates an approach to automated acceptance testing in developing software with Java. Acceptance tests directly tie into software requirements specification and the key for achieving maintainable tests is proper handling of traceability between the requirements and implementation as well as between the requirements and acceptance tests.

1. High-performance modern Java. The Graal name in the GraalVM comes from the Graal compiler. Graal is one compiler to rule them all, meaning that it's a single implementation of a compiler written as a library which can be used for many different things. For example we use Graal to compile both ahead-of-time and just-in-time, to compile multiple programming languages, and to multiple ...

Table 1 - Processor performance circa 1997. A 200 MHz MIPS R10000, a 300 MHz UltraSPARC and a 400 MHz Alpha 21164 were all about the same speed at running most programs, yet they differed by a factor of two in clock speed. A 300 MHz Pentium II was also about the same speed for many things, yet it was about half that speed for floating-point code such as scientific number crunching.
