Exercises and solutions 4 Exercise 2.1 We investigate the situation in which we have two eigenstates ϕ_1 and ϕ_2 of the Hamiltonian with energies E_1 and E_2 and $\tau \equiv \hbar/(E_1 - E_2)$. The expectation values of A are given by $A_{11} = a$, $A_{22} = -a$ and $A_{12} = a^3$.

quantum mechanics. Feynman has shown that one can formulate the outcome of a quantum mechanical measurement (probability to go from point 1 to 2) in terms of a weighted superposition of paths, of which the classical path is the most probable one. The amazing thing of quantum mechanics is that even for one electron more paths are possible.

Hence, if $\psi(x)$ is a solution of the Schrodinger equation, the following two functions must also be solutions: These are the even (ψ_e) and odd (ψ_o) parts of $\psi(x)$, respectively. Thus, in constructing the solutions of (5.1) for even $V(x)$, we may confine ourselves to all even and all odd solutions.
