The most basic problem in Numerical Analysis (methods) is the root-finding problem.. For a given function $f(x)$, the process of finding the root involves finding the value of x for which $f(x) = 0$. If the function equals zero, x is the root of the function. A root of the equation $f(x) = 0$ is also called a zero of the function $f(x)$.. The Bisection Method, also called the interval halving method ...

methods for finding solution of equations involves (1) Bisection method, (2) Method of false position (Regula-falsi Method), (3) Newton-Raphson method. A numerical method to solve equations may be a long process in some cases. If the method leads to value close to the exact solution, then we say that the method is
