Mechanical Mixture Vs Solution

Most important solutions contain one or more solids dissolved in a liquid. The solids are called solutes and the liquid is called the solvent. When the solutes are mixed with the solvent, the homogeneous solution is formed. A mechanical mixture is a mix of substances where the final sample is not homogeneous. Sand is a good example.

explain the difference between a mechanical mixture and a ...

The key difference between solutions and mechanical mixtures is that solutions contain dissolved substances whereas mechanical mixtures do not. The components of a solution do not separate when left standing and cannot be separated by filtration. A solution is a type of mixture.

A mechanical mixture is one that can be separated through mechanical means, such as a magnet or a centrifuge. Mechanical mixtures are not chemically bonded. While mechanical mixtures may be attracted to each other, there is no permanent gain or loss of electrons; they do not form different molecules.

Solutions and Mixtures Before we dive into solutions, let's separate solutions from other types of mixtures. Solutions are groups of molecules that are mixed and evenly distributed in a system. Scientists say that solutions are homogenous systems. Everything in a solution is evenly spread out and thoroughly mixed.
