Practice Questions: Multiple Regression

In the more general multiple regression model, there are independent variables: $y = \beta_0 + \beta_1 x_1 + \dots + \beta_k x_k + \epsilon$, where y is the i -th observation on the i -th independent variable. If the first independent variable takes the value 1 for all i , β_0 is called the regression intercept. The least squares parameter estimates are obtained from normal equations. The residual can be written as
