Dermatofibroma (superficial benign fibrous histiocytoma) is a common cutaneous nodule of

unknown etiology that occurs more often in women. Dermatofibroma frequently develops on the extremities (mostly the lower legs) and is usually asymptomatic, although pruritus and tenderness can be present.

Dermatofibroma: Background, Pathophysiology, Etiology

which new fibers can be formed. First, large fibers can split into two or more smaller fibers (i.e., fiber splitting) [8, 10, 32, 34].]. And perhaps the primary mechanism is via the activation and proliferation of satellite cells [18-20, 23, 52, 53].]. Satellite cells are myogenic stem cells which are involved in skeletal muscle regeneration.

Peak oil is the point in time when the maximum rate of global petroleum production is reached, after which the rate of production enters its terminal decline. If global consumption is not mitigated before the peak, an energy crisis may develop because the availability of conventional oil will drop and prices will rise, perhaps dramatically.
